

# Safety Valves

- Thermal Safety Valve
- Liquid & Safety Valve
- Pressure Relief Valve
- Oil & Gas Safety Valve
- Pilot Operated Safety Valve

## Thermal Safety Valve

We have gained excellent experience in manufacturing the safety valves. They are provided in number of specifications and designs to suit the industry requirement. The <u>thermal safety valves</u> are used in those locations that need to work with high temperature. They are great in dealing with varying temperature and can easily control the flow of substance.

#### Pilot Operated Safety Valve

The safety valve comes in different operating mode one of them is pilot operated valve. The pilot operated safety valve is controlled by the pressure that is maintained and managed by the pilot embedded in the safety valve.

These valves are made as per the requirement of the location and the need of the client.

#### Liquid & Safety Valve

The safety valves helps in controlling the flow of liquid to a safe speed and time. The liquid & safety valve is a pressure relief valve that is activated on the pressure of the upstream of the valve. These valves are classified on the rapid opening or pop up action of the valve.

#### Pressure Relief Valve

A relief valve is an automatic pressure relieving device operated by the upstream pressure of the valve. They are made from to quality of material and latest technology to control the pressure in the valve.

The <u>pressure relief valve</u> is designed and checked by the experts for their quality and efficiency.

### Oil & Gas Safety Valve

The safety valve is used to control the pressure and flow of substance. They are used in number of industries. The oil and gas safety valve is used in the oil and gas processing industry. They are used to accurately control the pressure and handle the effective working. The safety valves are made in standard specifications and are even customized on client request.
